Image Denoising and Deblurring

Mathematical Formulation

$$Ax + w = b$$

Diagram illustrating the mathematical formulation of image denoising:

- Ax is labeled "Blur operator" (indicated by a downward arrow).
- w is labeled "Noise" (indicated by a downward arrow).
- b is labeled "Observed image" (indicated by an upward arrow).
- The term x is labeled "True image" (indicated by an upward arrow).

- Blur: Ax is a discrete convolution of the true image with a Gaussian kernel (reflexive boundary conditions).
- Noise: w is noise drawn from a Gaussian or Student's t distribution.

Naive Solution: $x = A^{-1}b$

True image

Blurred image

Recovered image

Naive Solution: $x = A^{-1}(b - w)$

True image

Blurred and noisy image

Recovered image

Since the blur operator is ill-conditioned, a better approach is to minimize a regularized loss function.

General Objective Function

$$L_b(x) = \underbrace{f(Ax - b)}_{\text{Fidelity term}} + \underbrace{\lambda R(x)}_{\text{Regularization}}$$

Fidelity Terms

$$f = \begin{cases} \|\cdot\|_F^2 \\ h_\gamma(\cdot) \\ \gamma^{-1} \log(\cosh(\gamma \cdot)) \end{cases}$$

Regularization Terms

$$R = \begin{cases} \|Wx\|_1 \\ TV(x) \end{cases}$$

Fidelity Term Penalty Functions

The fidelity term $f(Ax - b)$ measures how well our results comply with the linear blurring model. Depending upon the type of noise present in the observed image, the choice of penalty function may influence the efficacy of our deblurring/denoising procedure.

Gaussian Noise

Due to the lack of outliers, the quadratic penalty is sufficient

$$f(z) = \frac{1}{2} \|z\|^2$$

Student's t Noise

Huber penalty preferred since it is more robust to heavy-tailed noise

$$f(z) = \min_y \frac{1}{2} \|z - y\|^2 + \gamma \|y\|_1$$

L1 Wavelet Regularization

$$L_b(x) = f(Ax - b) + \lambda \|Wx\|_1$$

Haar Transform (2 Levels)

Images are often sparse in wavelet domains, so the L1 wavelet regularizer can be used to encourage this property in our recovered image.

For our examples, we let W be the orthogonal 2D Haar wavelet transform using 5 levels.

Total Variation Regularization

$$L_b(x) = f(Ax - b) + \lambda TV(x)$$

Choosing λ

Total Variation Regularization

Loss Function

$$L_b(x) = f(Ax - b) + \lambda \text{TV}(x) + \delta(x|_{[0,1]})$$

Proximal Gradient Step

$$\begin{aligned} x^{k+1} &= \text{prox}_{\alpha^{-1}(\lambda \|\cdot\|_{\text{TV}} + \delta_{[0,1]})} \left(\underbrace{x^k - \alpha^{-1} A^T \nabla f(Ax^k - b)}_{u^k} \right) \\ &= \arg \min_z \left(\|u^k - z\|_F^2 + \alpha^{-1} \lambda \|z\|_{\text{TV}} + \delta(z|_{[0,1]}) \right) \\ &= P_{[0,1]} \left(\arg \min_z \left(\|u^k - z\|_F^2 + \alpha^{-1} \lambda \|z\|_{\text{TV}} \right) \right) \end{aligned}$$

Dual Form of Total Variation

A Few Definitions

- $\mathcal{P} = \{(p, q) \in \mathbb{R}^{(m-1) \times n} \times \mathbb{R}^{m \times (n-1)} : |p_{i,j}| \leq 1, |q_{i,j}| \leq 1\}$,
- $\mathcal{L} : \mathbb{R}^{(m-1) \times n} \times \mathbb{R}^{m \times (n-1)} \rightarrow \mathbb{R}^{m \times n}$ such that

$$\mathcal{L}(p, q)_{i,j} = p_{i,j} + q_{i,j} - p_{i-1,j} - q_{i,j-1}$$

for $i = 1, \dots, m, j = 1, \dots, n$, and

$$p_{0,j} = p_{m,j} = q_{i,0} = q_{i,n} = 0.$$

- P_C is the usual projection operator onto the set C

Total Variation

$$\text{TV}(x) = \max_{p,q \in \mathcal{P}} T(x, p, q) \implies T(x, p, q) = \text{Tr}(\mathcal{L}(p, q)^T x).$$

Dual Form of TV Denoising with $\|\cdot\|_F^2$

The problem:

$$\min_{x \in C} \|x - b\|_F^2 + 2\lambda \text{TV}(x), \quad C = [0, 1]$$

Dual problem:

$$\min_{(p,q) \in \mathcal{P}} \underbrace{-\|H_C(b - \lambda \mathcal{L}(p, q))\|_F^2 + \|b - \lambda \mathcal{L}(p, q)\|_F^2}_{h(p,q)}$$

$$H_C(x) = \underbrace{x - P_C(x)}_{\text{prox}}$$

Optimality conditions:

$$x = P_C(b - \lambda \mathcal{L}(p, q)).$$

Optimization of Dual Form

Problem Statement

$$\min_{(p,q) \in \mathcal{P}} \left\{ \|b - \lambda \mathcal{L}(p, q)\|_F^2 - \|(I - P_{[0,1]})(b - \lambda \mathcal{L}(p, q))\|_F^2 \right\}$$

$$\min_{(p,q)} \left\{ \underbrace{\|b - \lambda \mathcal{L}(p, q)\|_F^2 - \|(I - P_{[0,1]})(b - \lambda \mathcal{L}(p, q))\|_F^2}_{=h(p,q)} + \delta((p, q) | \mathcal{P}) \right\}$$

$$\nabla h(p, q) = -2\lambda \mathcal{L}^T P_{[0,1]}(b - \lambda \mathcal{L}(p, q))$$

Lipschitz with constant $\leq 16\lambda^2$

\Rightarrow Use projected gradient

Optimization in Dual Form

Projection onto \mathcal{P}

Recall $\mathcal{P} = (p, q) \in [-1, 1]^{m-1 \times n} \times [-1, 1]^{m \times n-1}$

$$P_{\mathcal{P}}(p, q) = (r, s) \text{ with } \begin{cases} r_{ij} = \text{sgn}(p_{ij}) \min\{1, |p_{ij}|\} \\ s_{ij} = \text{sgn}(q_{ij}) \min\{1, |q_{ij}|\} \end{cases}$$

Projected Gradient Step

$$(p^{k+1}, q^{k+1}) = P_{\mathcal{P}} \left((p^k, q^k) + \frac{1}{8\lambda} \mathcal{L}^T P_{[0,1]}(b - \lambda \mathcal{L}(p, q)) \right)$$

Monotone FISTA TV Regularization

MFISTA(b, f, λ)

$$y^1 = x^0 = b; t^1 = 1$$

$$\alpha \geq \text{Lip}(\nabla f)$$

for $k = 1 : N$ **do**

$$u^k = y^k - \frac{A^T \nabla f(Ay^k - b)}{\alpha}$$

$$z^k = \text{FGP}(u^k, \frac{\lambda}{2\alpha})$$

$$x^k = \underset{x \in \{x^{k-1}, z^k\}}{\text{argmin}} L_b(x)$$

$$t^{k+1} = \frac{1 + \sqrt{1 + 4t^{k2}}}{2}$$

$$y^{k+1} = x^k + \frac{t^k}{t^{k+1}}(z^k - x^k) + \frac{t^{k-1}}{t^{k+1}}(z^k - x^k)$$

end for

return x^N

FGP(b, λ)

$$(r_{ij}^1, s_{ij}^1) = (p_{ij}^0, q_{ij}^0) = 0; t^1 = 1$$

for $k = 1 : N$ **do**

$$(p^k, q^k) = P_{\mathcal{P}} \left((r^k, s^k) - \frac{\mathcal{L}^T P_{[0,1]}(b - \lambda \mathcal{L}(r^k, s^k))}{8\lambda} \right)$$

$$t^{k+1} = \frac{1 + \sqrt{1 + 4t^{k2}}}{2}$$

$$(r^k, s^k) = (p^k, q^k) + \frac{t^k - 1}{t^{k+1}}(p^k - p^{k-1}, q^k - q^{k-1})$$

end for

return $P_{[0,1]}(b - \lambda \mathcal{L}(p^N, q^N))$

Conclusions

Wavelet vs. Total Variation

- Total variation seems to do better for high amounts of noise.
- **How do they compare on timing???? Any advantages of Wavelet???**

Frobenius vs Huber

- On Gaussian noise, the two are comparable.
- Huber outperforms Frobenius on noise with heavier tail.

Challenges

- Ideal parameter values change image to image.
- How can we quantitatively evaluate performance?
- How can we optimize parameters without performance metric?

Questions?
